The DS207 is the best NAS we have seen so far here at *PC World*. Willing to stand out in a crowd, Synology has added some extra features not normally – but important nevertheless – found in traditional NAS devices.

One of the features that stands out is the iTunes server functionality. When enabled, any computer connected to the network with a copy of iTunes installed can browse and play music. The DS207 can also act as a video server or an FTP, web or BitTorrent server. It even has a Photo Station interface to access web-based photo accounts.

Setup is fairly easy and requires just connecting the DS207 to the network and loading the bundled software on any computer connected to that network. Though pricey, the added capabilities of this NAS device has earned it our editors' choice award for a home and small office NAS.
